UDDHAR · PHITRON PRODUCTION TOOL

Claude Video Maker v1

Turn a script, a voiceover and a style into a finished reel. Every video is a **project**: you fill in its inputs once, review the brief, and Claude builds it with the same styles, brand rules and GPU pipeline the team already uses.

Developed by Kazi Md. Shahriar for Uddhar · v1.0.0

Download the installer

Claude-Video-Maker-Setup.exe · Windows 10/11 · about 180 KB (it fetches the engine from GitHub)

Download installer | Open Drive folder

Project based

One project per reel. Every choice is saved in a single `project.json`, so nothing is lost and anything can be repeated.

Your styles, your brand

Pick a style from the library, add references with notes, apply the Uddhar brand kit. Save any good result as a new style.

Safe and controlled

Brief Review before generation, storyboard approval gate, lock files, versions you can compare, and targeted revisions.

Runs on your RTX GPU

NVIDIA RTX by default. Switch to Auto or CPU only per project or for the whole app.

STEP 0

Install

Takes about five minutes the first time. After that, one click on the desktop icon opens the app and updates it.

What the PC needs

TOOL	WHY	GET IT
Windows 10 / 11	The app and installer are Windows only	—
Node.js LTS	Runs the app and the render engine	`winget install OpenJS.NodeJS.LTS`
Git for Windows	Downloads updates; provides `bash` for the render script	`winget install Git.Git`
FFmpeg	Posters, video checks, encoding	`winget install Gyan.FFmpeg`
Claude Code CLI, signed in	The generator. Run `claude` once and sign in	claude.com/claude-code
NVIDIA GPU (recommended)	Fast render. Without it use GPU: Auto or CPU only in Settings	Latest NVIDIA driver

Method A: one-click setup (recommended)

1. Click **Download installer** above (or take `Claude-Video-Maker-Setup.exe` from the Drive folder).
2. Double-click it. If Windows SmartScreen warns (the file is not code-signed), choose **More info** → **Run anyway**.
3. It downloads the engine into `Documents\Claude Video Maker\engine`, installs packages, and creates the **Claude Video Maker** shortcuts on the Desktop and in the Start Menu.
4. If it lists a missing tool, install it with the command shown, then run the setup again.

Method B: from a copy of the repository

```
git clone https://github.com/ShahriarAbir86/uddhar-discrete-math-reels.git
cd uddhar-discrete-math-reels
Install-Claude-Video-Maker.cmd
```

First run checklist

1. Open the app, then **Settings** → **This PC**: Claude Code, Node, FFmpeg, Git Bash and Engine should all say found or ready.
2. Set the **Export folder** (where finished videos go) and, if you use Google Drive for desktop, the **Google Drive folder**.
3. Check GPU shows **NVIDIA RTX** and your card is named.

Update: every launch pulls the newest version. You can also press Settings → Check for updates. **Remove:** delete the two shortcuts and the `Documents\Claude Video Maker` folder (your projects are in there, so keep it if you want them).

FASTEST PATH

Make your first reel in 5 steps

1
New Project
Projects → **+ New Project**. Name it, e.g. “EP03 Pigeonhole Principle”.

2
Fill the Composer
Paste the script, choose a style (and Light or Dark), add the voiceover and any references.

3
Review & Generate
Check the Brief Review. Generate the storyboard first.

4
Approve
Read the storyboard and press **Approve & build video**. Watch the live log.

5
Revise & Export
Ask for targeted changes if needed, then **Export** to your folders.

ROLES

Who does what

One person can play all three roles. The split shows which parts of the app matter to whom.

ROLE	GOAL	USES	TYPICAL ACTIONS

Creator / producer	Make a reel from a script and voiceover	Projects, Composer, Brief Review, Results, Library	Create project, fill inputs, generate, approve storyboard, revise, export, save a style
Reviewer	Judge quality and compare options	Results (Preview, Versions, Revise), Review Desk	Watch, copy timestamps, compare v1 with v2, write scene feedback, check time and token cost
Setup owner / admin	Install, update and tune the app for the team	Installer, Settings, Library (Brand Kits, Styles)	Install on each PC, set folders, choose GPU and model defaults, maintain brand kit and styles, protect finished projects with Lock

EVERYTHING IN ONE PLACE

Feature map

Every feature, where to find it, and what it does.

FEATURE	WHERE	WHAT IT DOES
Project cards	Projects	Thumbnail, date, status (Draft, Generating, Generated, Exported), version count
Search and filters	Projects	Filter by name, style, status; sort newest, oldest or by name
New / Duplicate project	Projects	Start blank or copy an earlier project's inputs
Delete project	Projects (hover a card)	Moves it to a hidden trash folder, nothing else is touched
Import earlier episodes	Projects (empty state)	Brings EP01 and EP02 work in as projects
Content	Composer	Script, storyline, any files or whole folders (browse or drag and drop)
Style picker	Composer	Choose from the style library; Animation Story requires Light or Dark; per-project style notes
References + notes	Composer	Videos, images or links, each with a note saying what to take
Brand Kit	Composer	Logo position and size, colours, fonts, watermark, intro, outro
Special Assets	Composer	Stickers, B-roll, SFX, each with where to use it
Audio	Composer	Voiceover (timing source), background music, music volume, ducking
Output settings	Composer	Reels / Shorts / TikTok 9:16, YouTube 16:9, square; length, resolution, FPS, captions on/off and style
Engine & Render	Composer	Per-project GPU, render quality, Claude model, thinking effort, storyboard gate
Extra instructions	Composer	Free text in Bangla or English
Show Brief	Composer	Exactly what will be sent to Claude, copyable
Lock project	Composer	Blocks edits and generation, to protect an approved project
Brief Review	Review & Generate	Lists every file and choice; warns about missing or moved files, missing notes, no voiceover, GPU problems
Storyboard gate	Generate	Claude stops after the storyboard; you approve, with optional notes, before the build

Live log	Results → Log	Tools Claude used, decisions it narrated, and errors, as they happen
Stop	Results	Cancels a running generation
Production summary	Results → Preview	Active time, tokens, turns, API cost estimate, GPU and quality per version
Versions + compare	Results → Versions	v1, v2, v3 listed; pick two to play side by side
Revise	Results → Revise	Scene number, timestamp (⏱ grabs current time) and what to change; creates a new version, keeps the rest
Export	Results → Export	Copies MP4, storyboard, brief and run summary to the Export folder and the Drive folder
Download MP4	Results → Preview	One-click download of the selected version
Save as Style	Results → Preview	Turns a finished video's look into a reusable style with a thumbnail
Styles library	Library	Built-in Whiteboard and Animation Story, your own, new style from reference, optional “Analyze with Claude”
Brand Kits	Library	Uddhar kit built in; create more (logo, colours, fonts, position, size, outro)
References and Assets	Library	Saved items with notes, added to any project in one click
Review Desk	Review Desk	All episodes with production summary and style comparison (the earlier preview app)
GPU choice	Settings / Engine	NVIDIA RTX only, Auto, or CPU only
Model, effort, permissions	Settings	Claude model, thinking effort, Accept edits or Bypass all prompts, max run time
Folders	Settings	Data, Export, Google Drive, Claude CLI path
Lock files	Automatic	Prevents two runs at once and edits during a run; cleaned up after a crash
Auto-export, keep logs	Settings	Export when a video finishes; keep each run's log
Update / Quit	Settings	Pull the latest version; stop the app

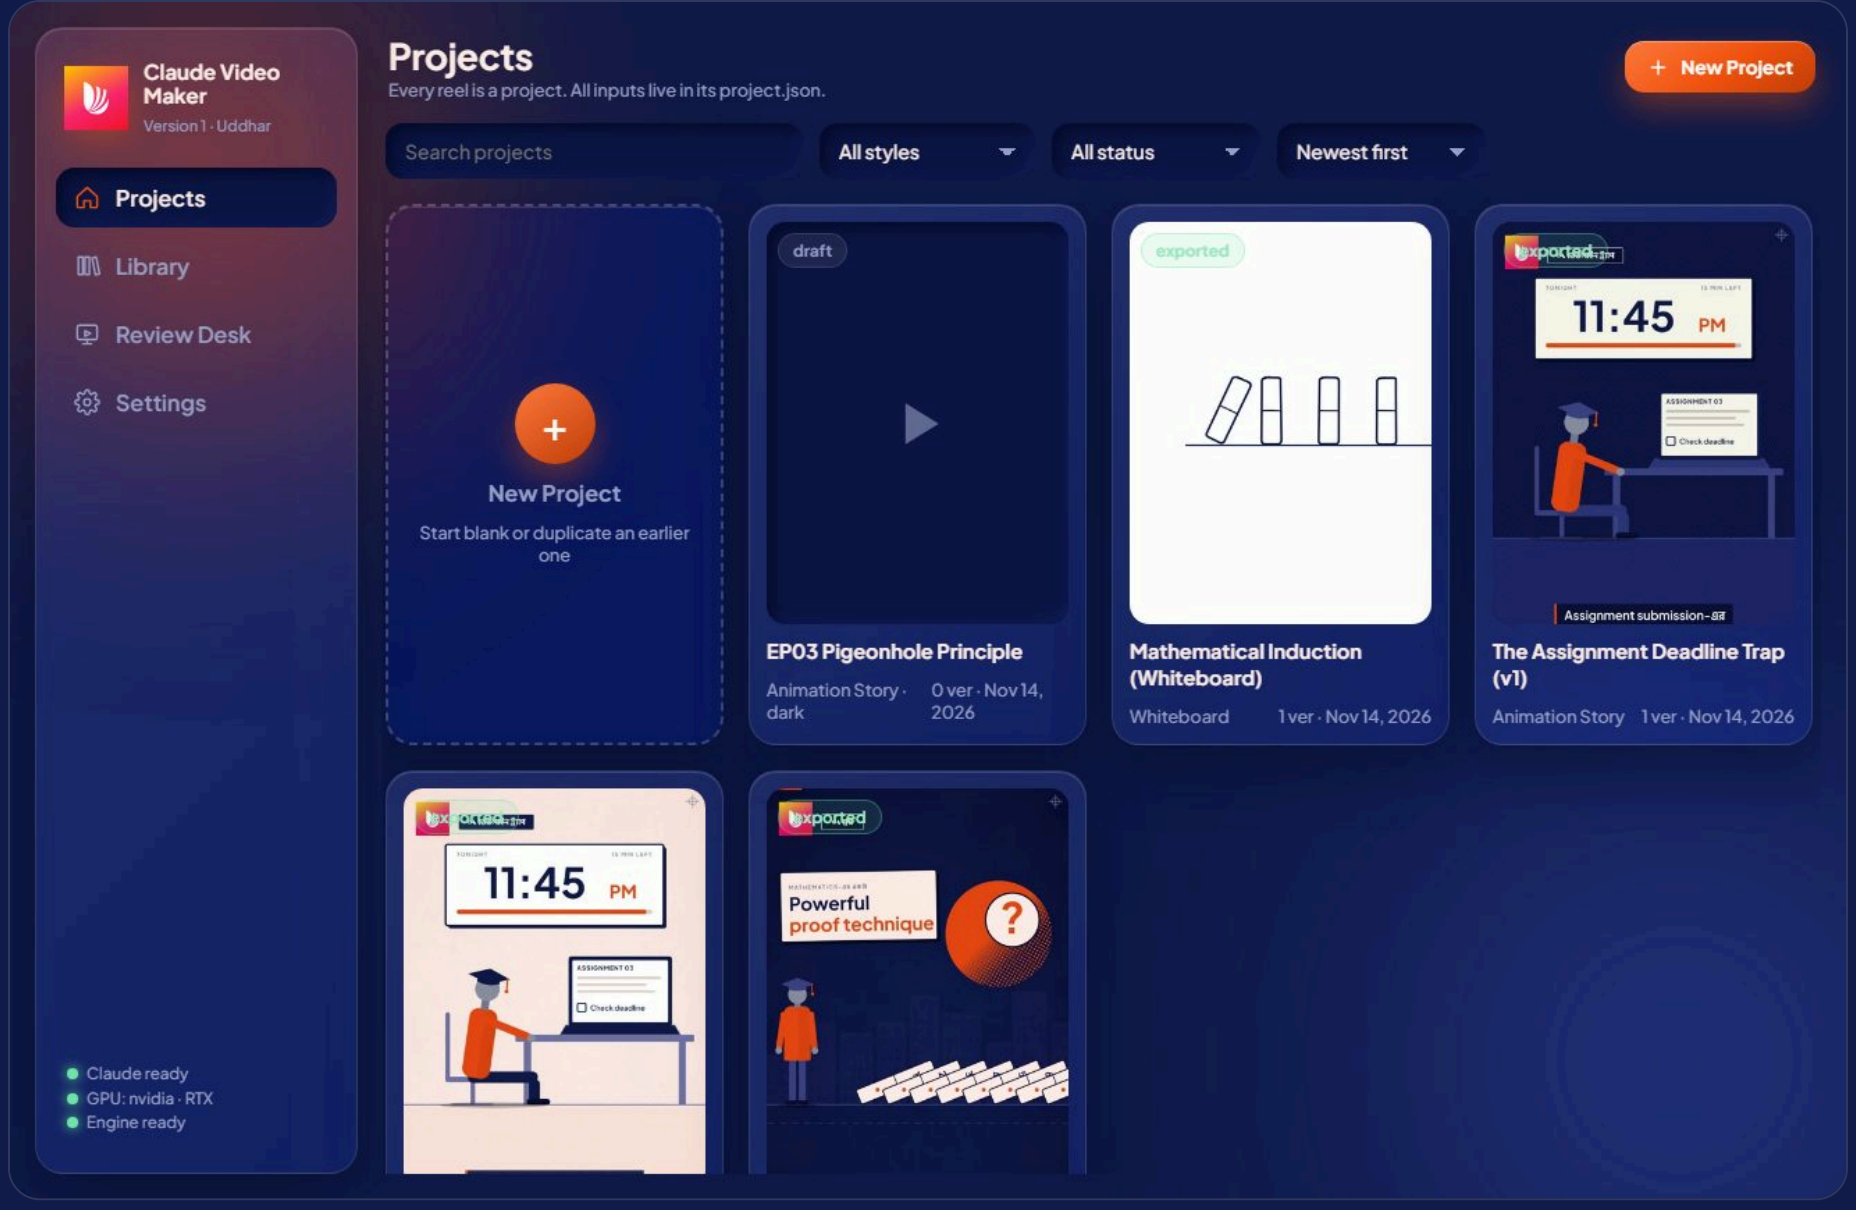

SCREEN BY SCREEN

Screen tour

Click any picture to enlarge it.

1 · Projects

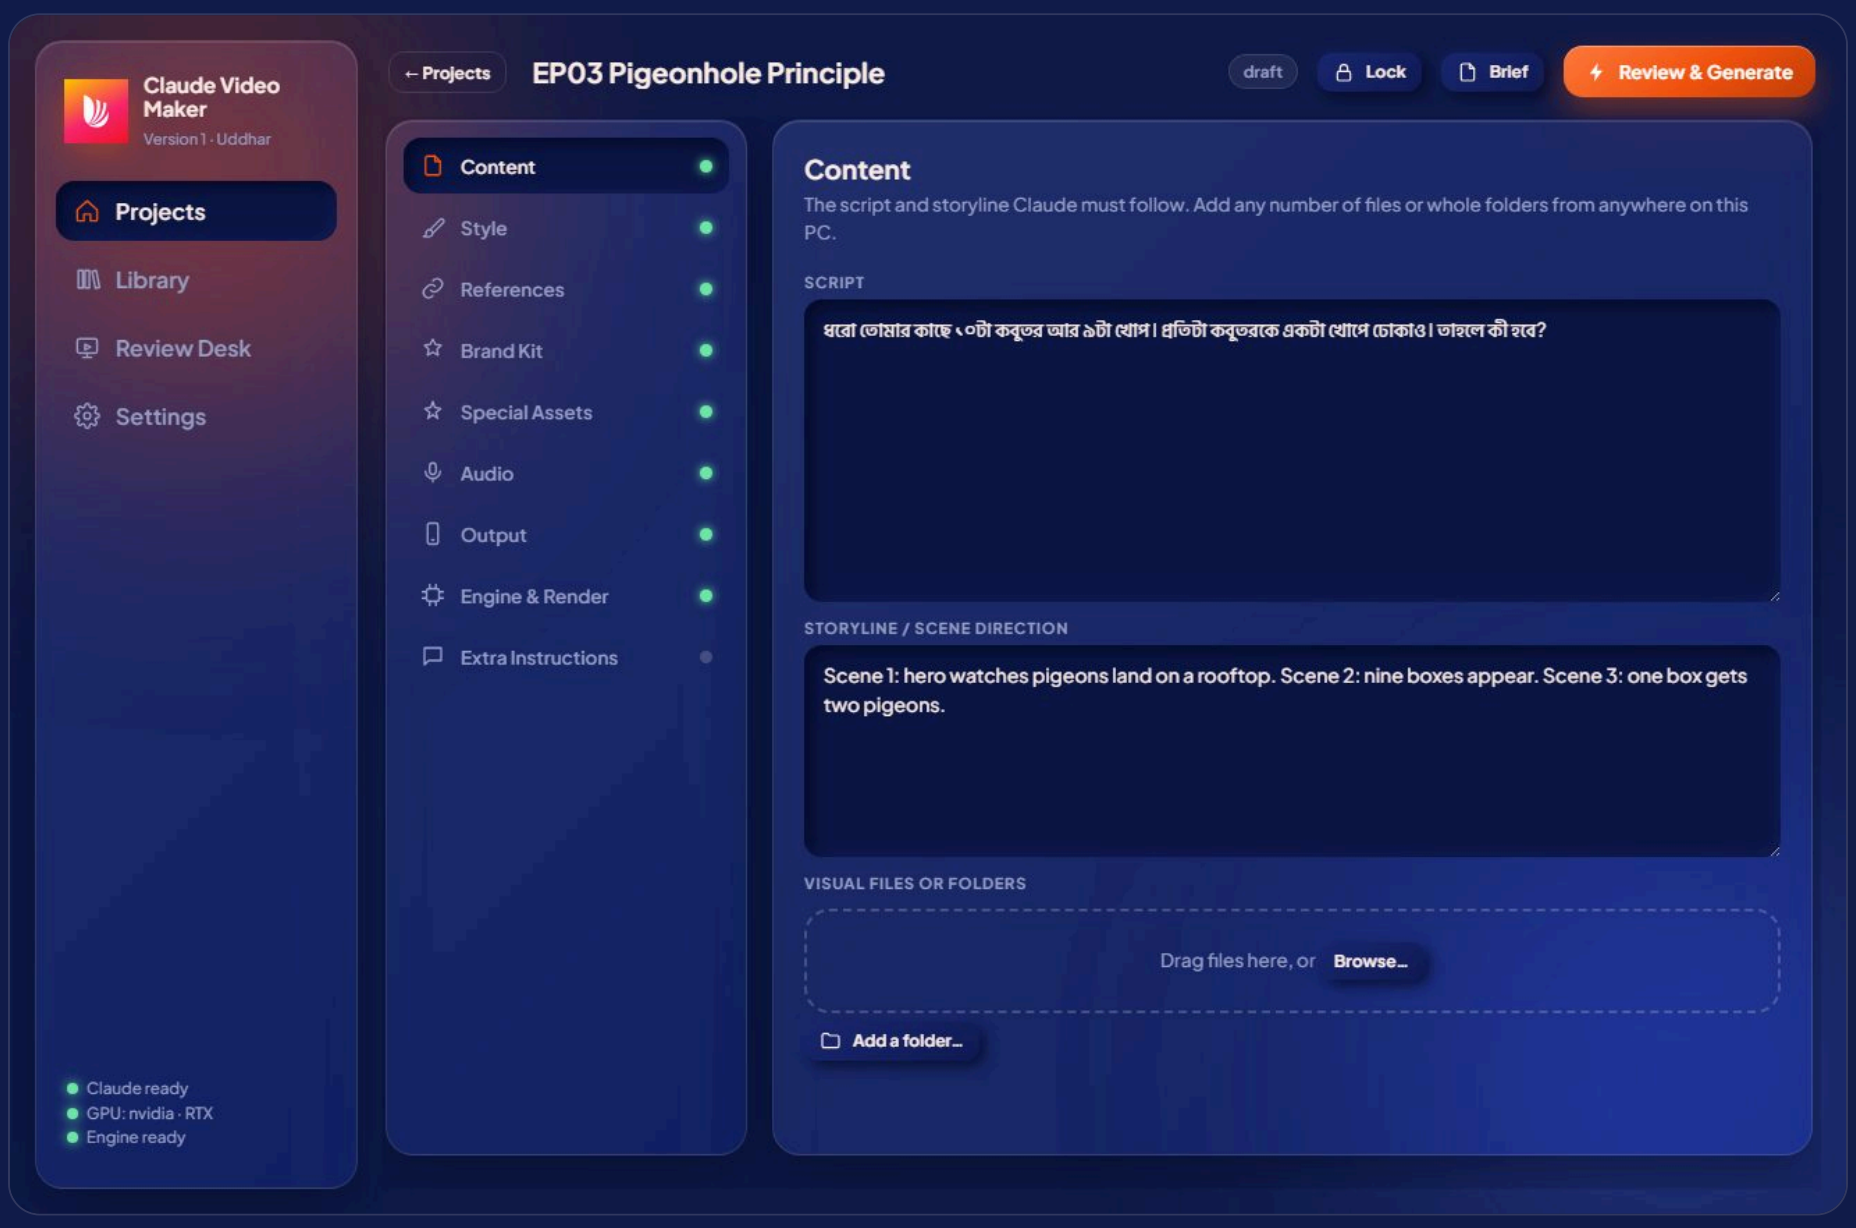

Your dashboard. Cards show the thumbnail, style and mode, version count and date.

Projects: search, filter, New Project, duplicate and delete on hover.

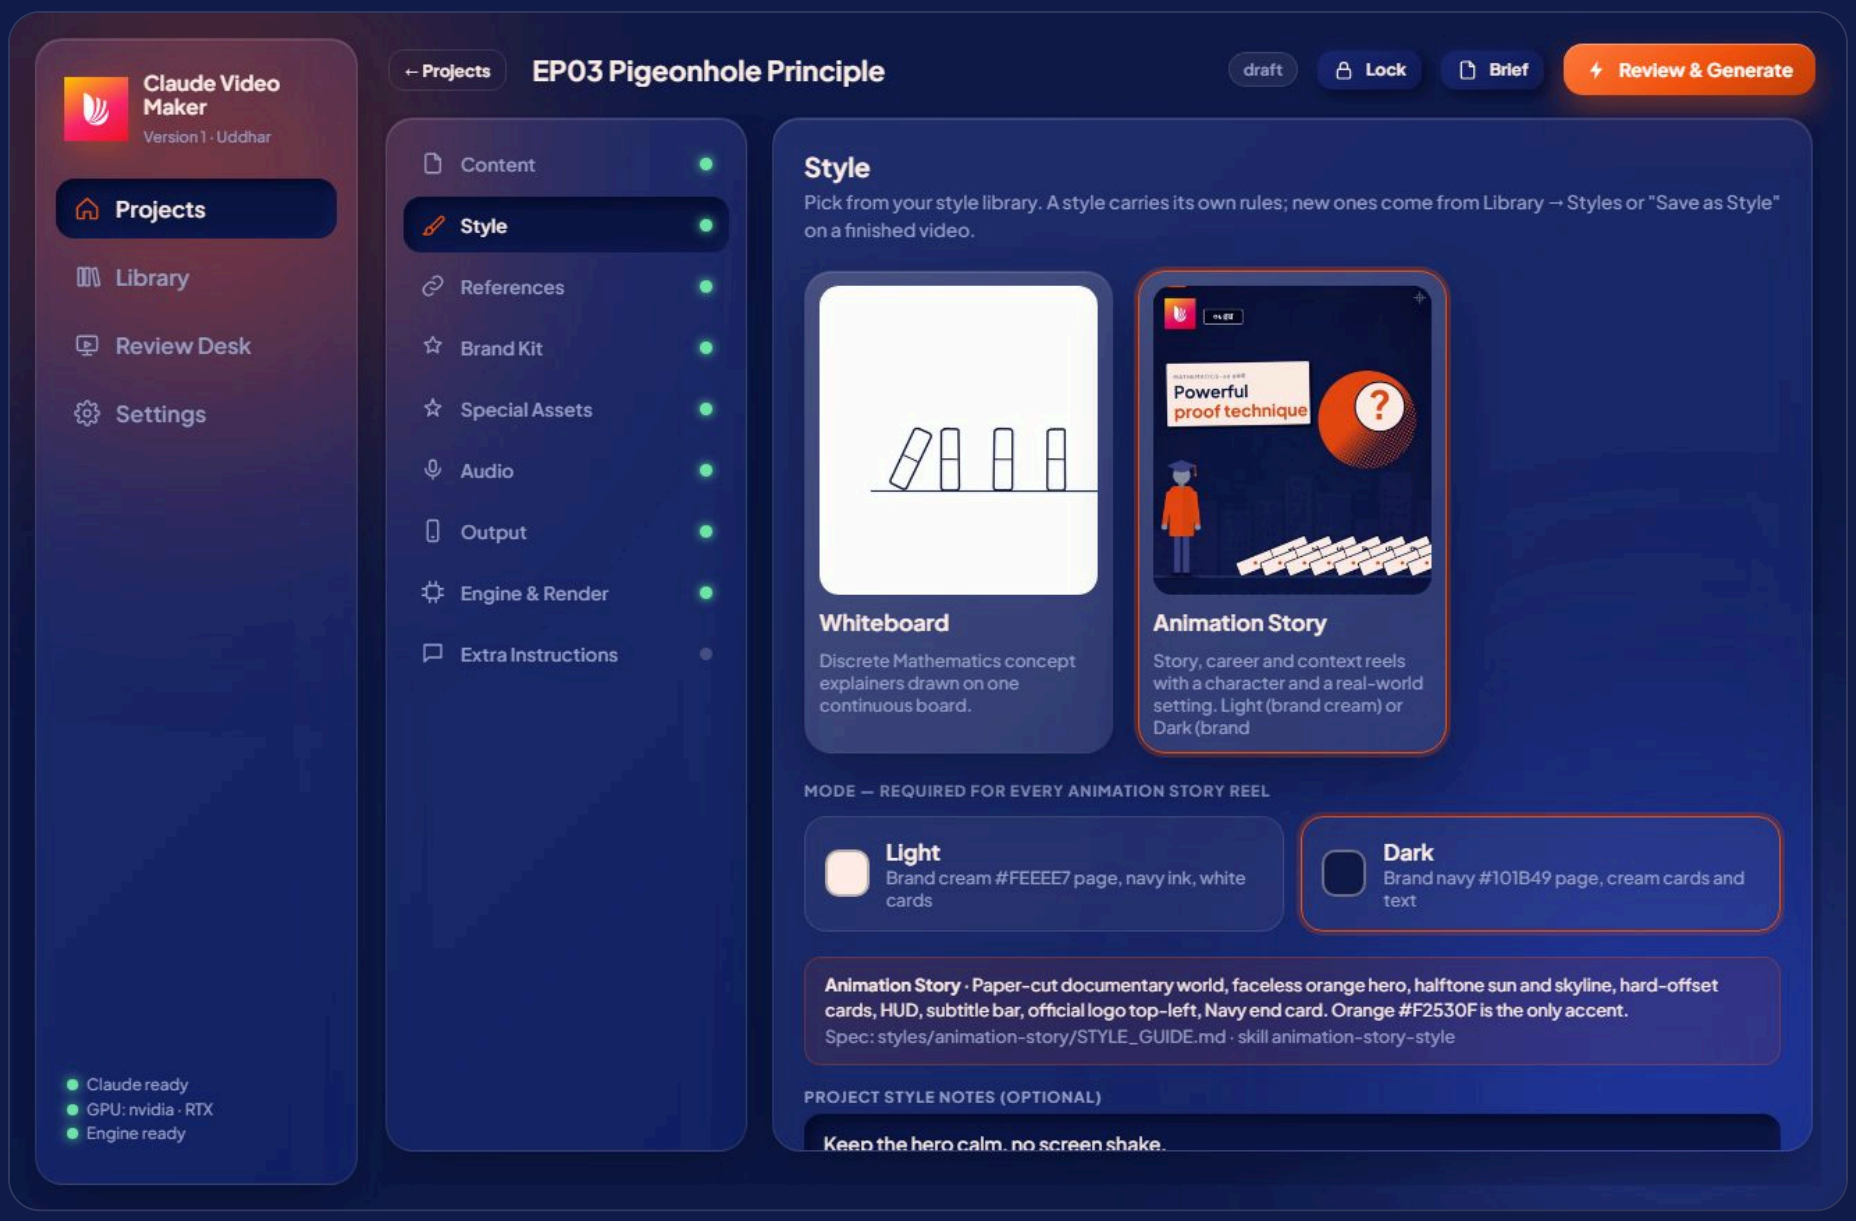

2 · Composer: Content

The left list shows every input section. A green dot means ready, orange means something required is missing.

Script, storyline and files.

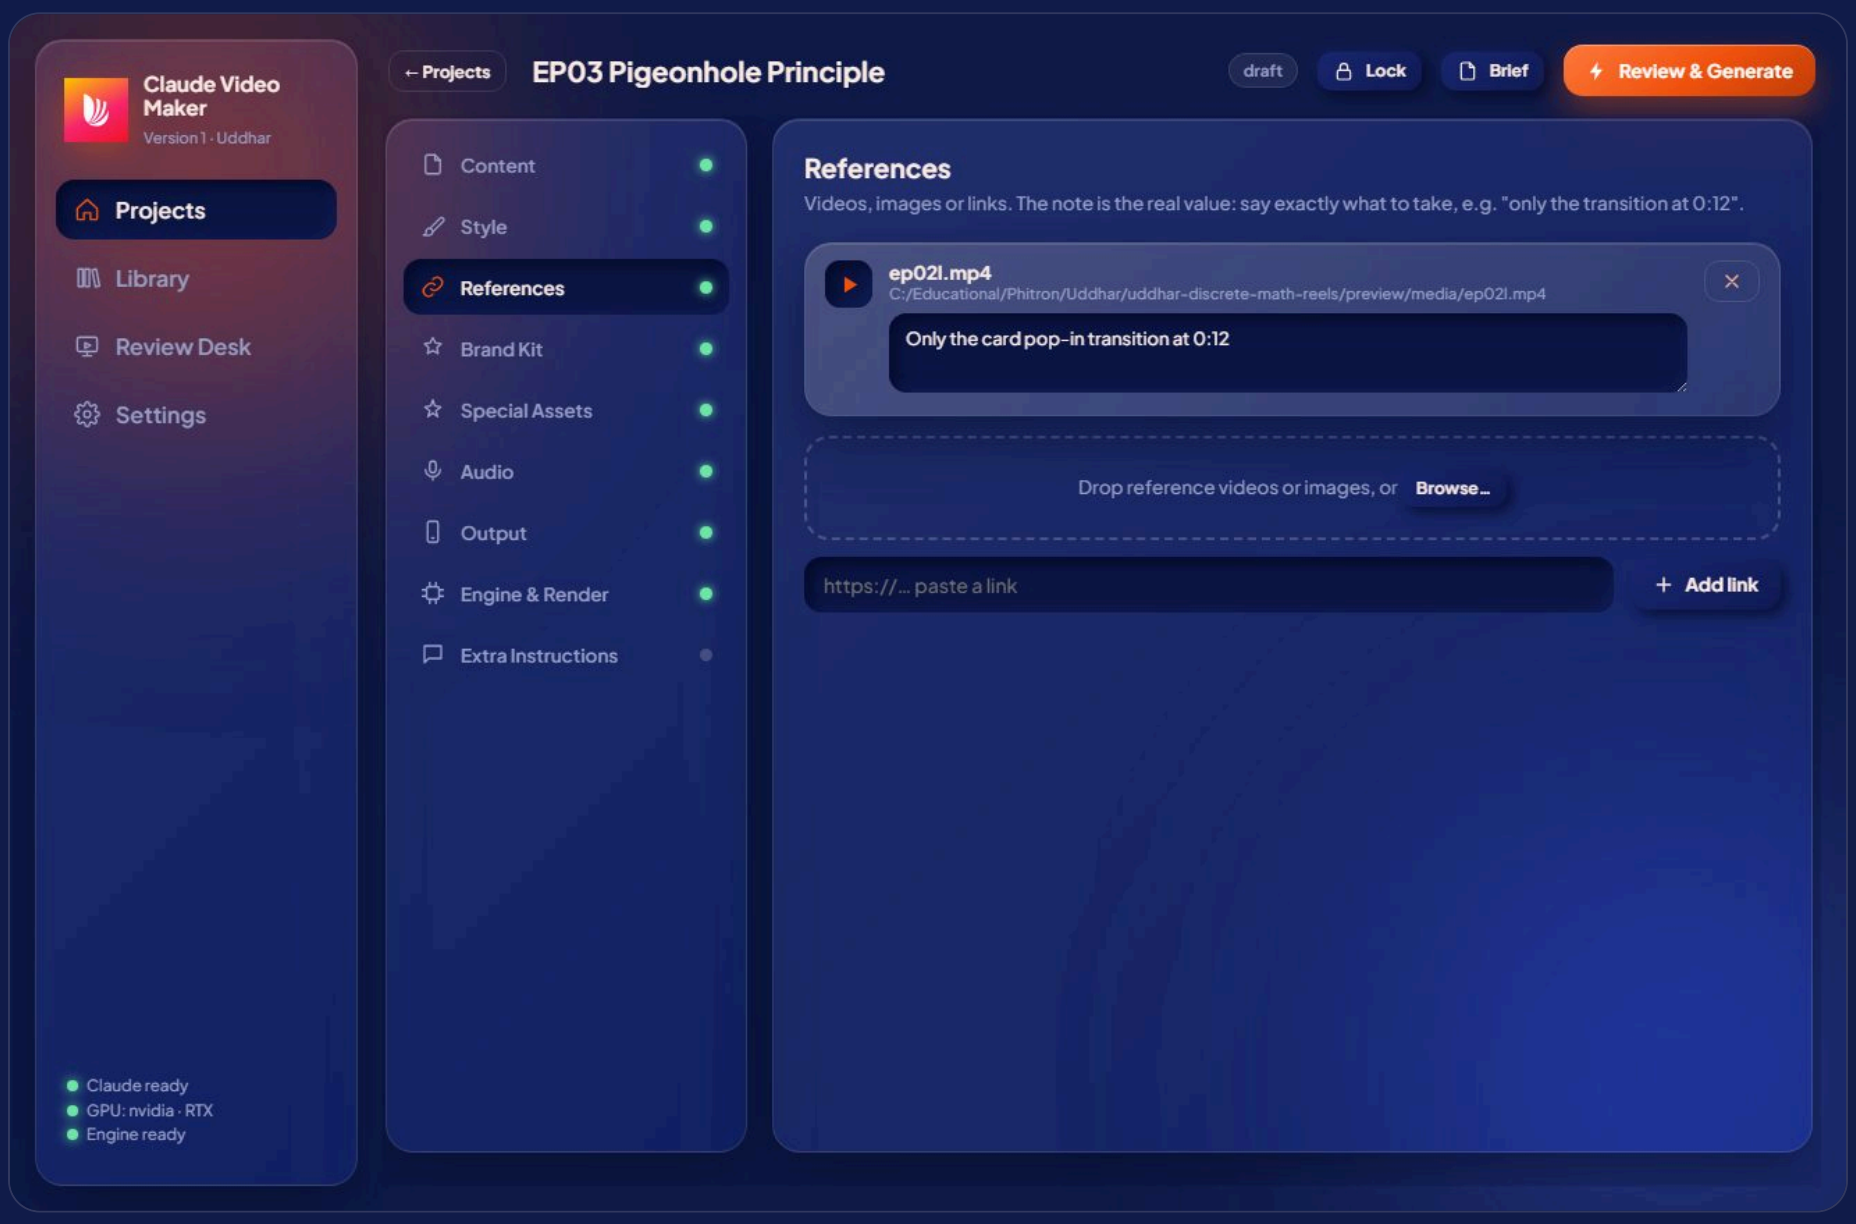

3 · Composer: Style

Pick a style; Animation Story needs Light (brand cream) or Dark (brand navy).

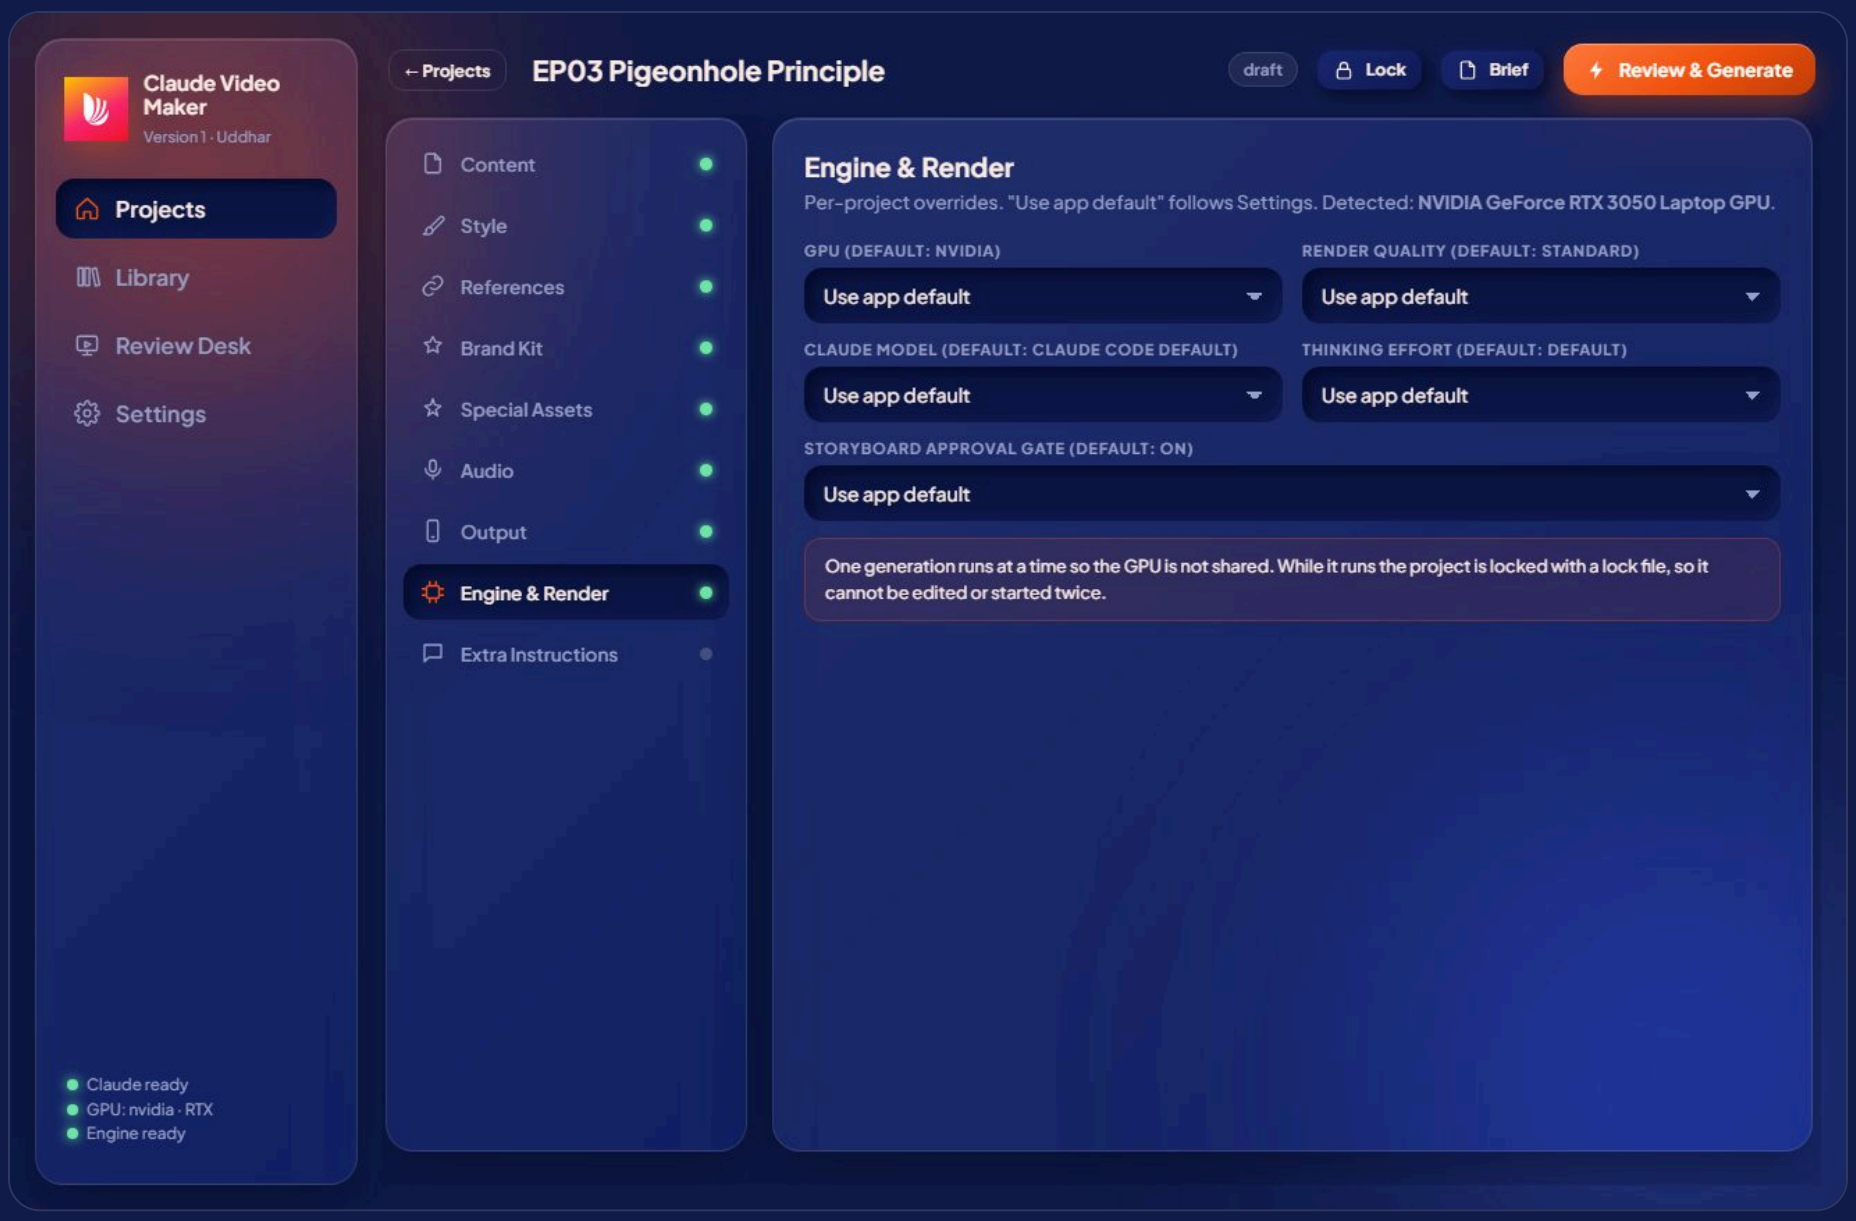

4 · Composer: References

The note is what gives a reference its value. Say exactly what to take from it.

Each reference carries its own note.

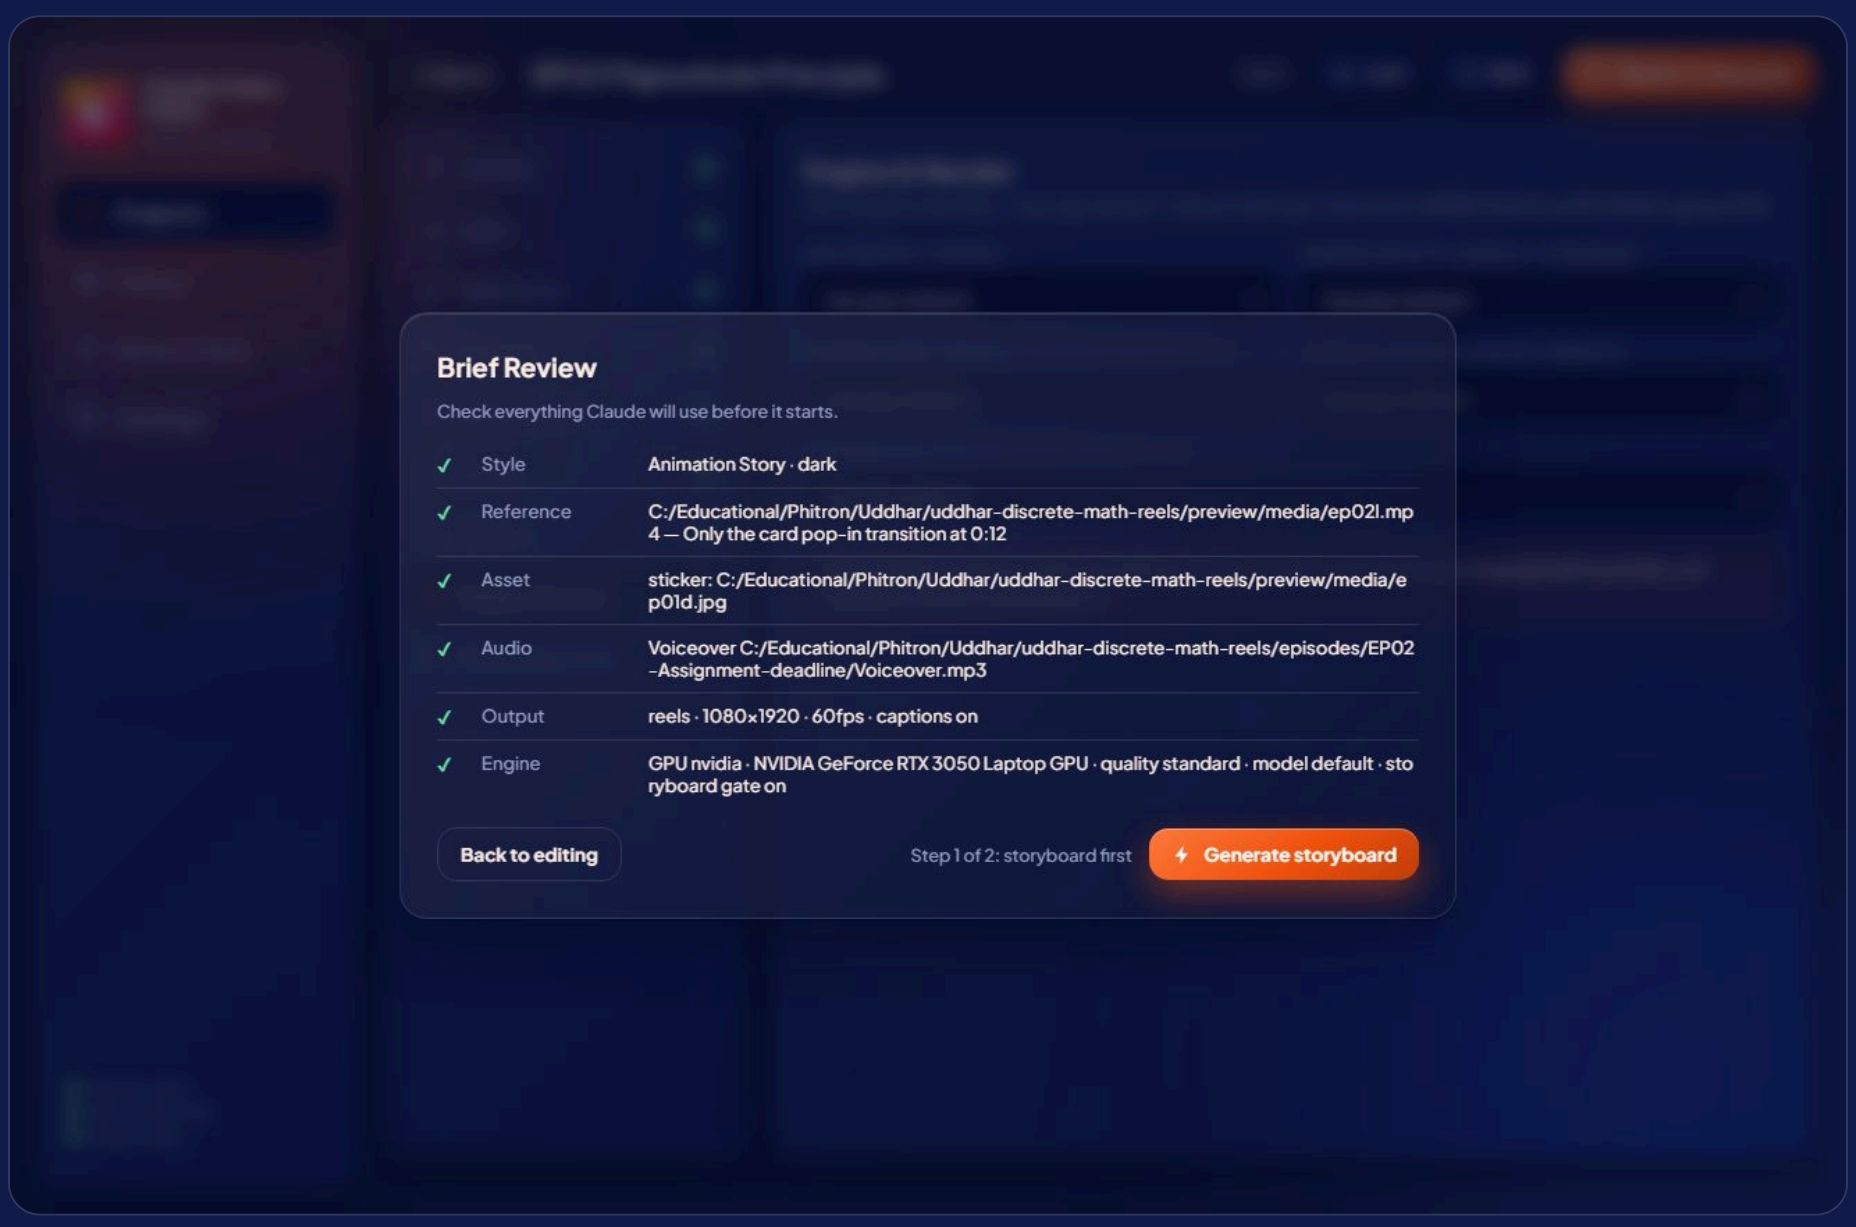

5 · Composer: Engine & Render

GPU, quality, model, effort and storyboard gate, per project.

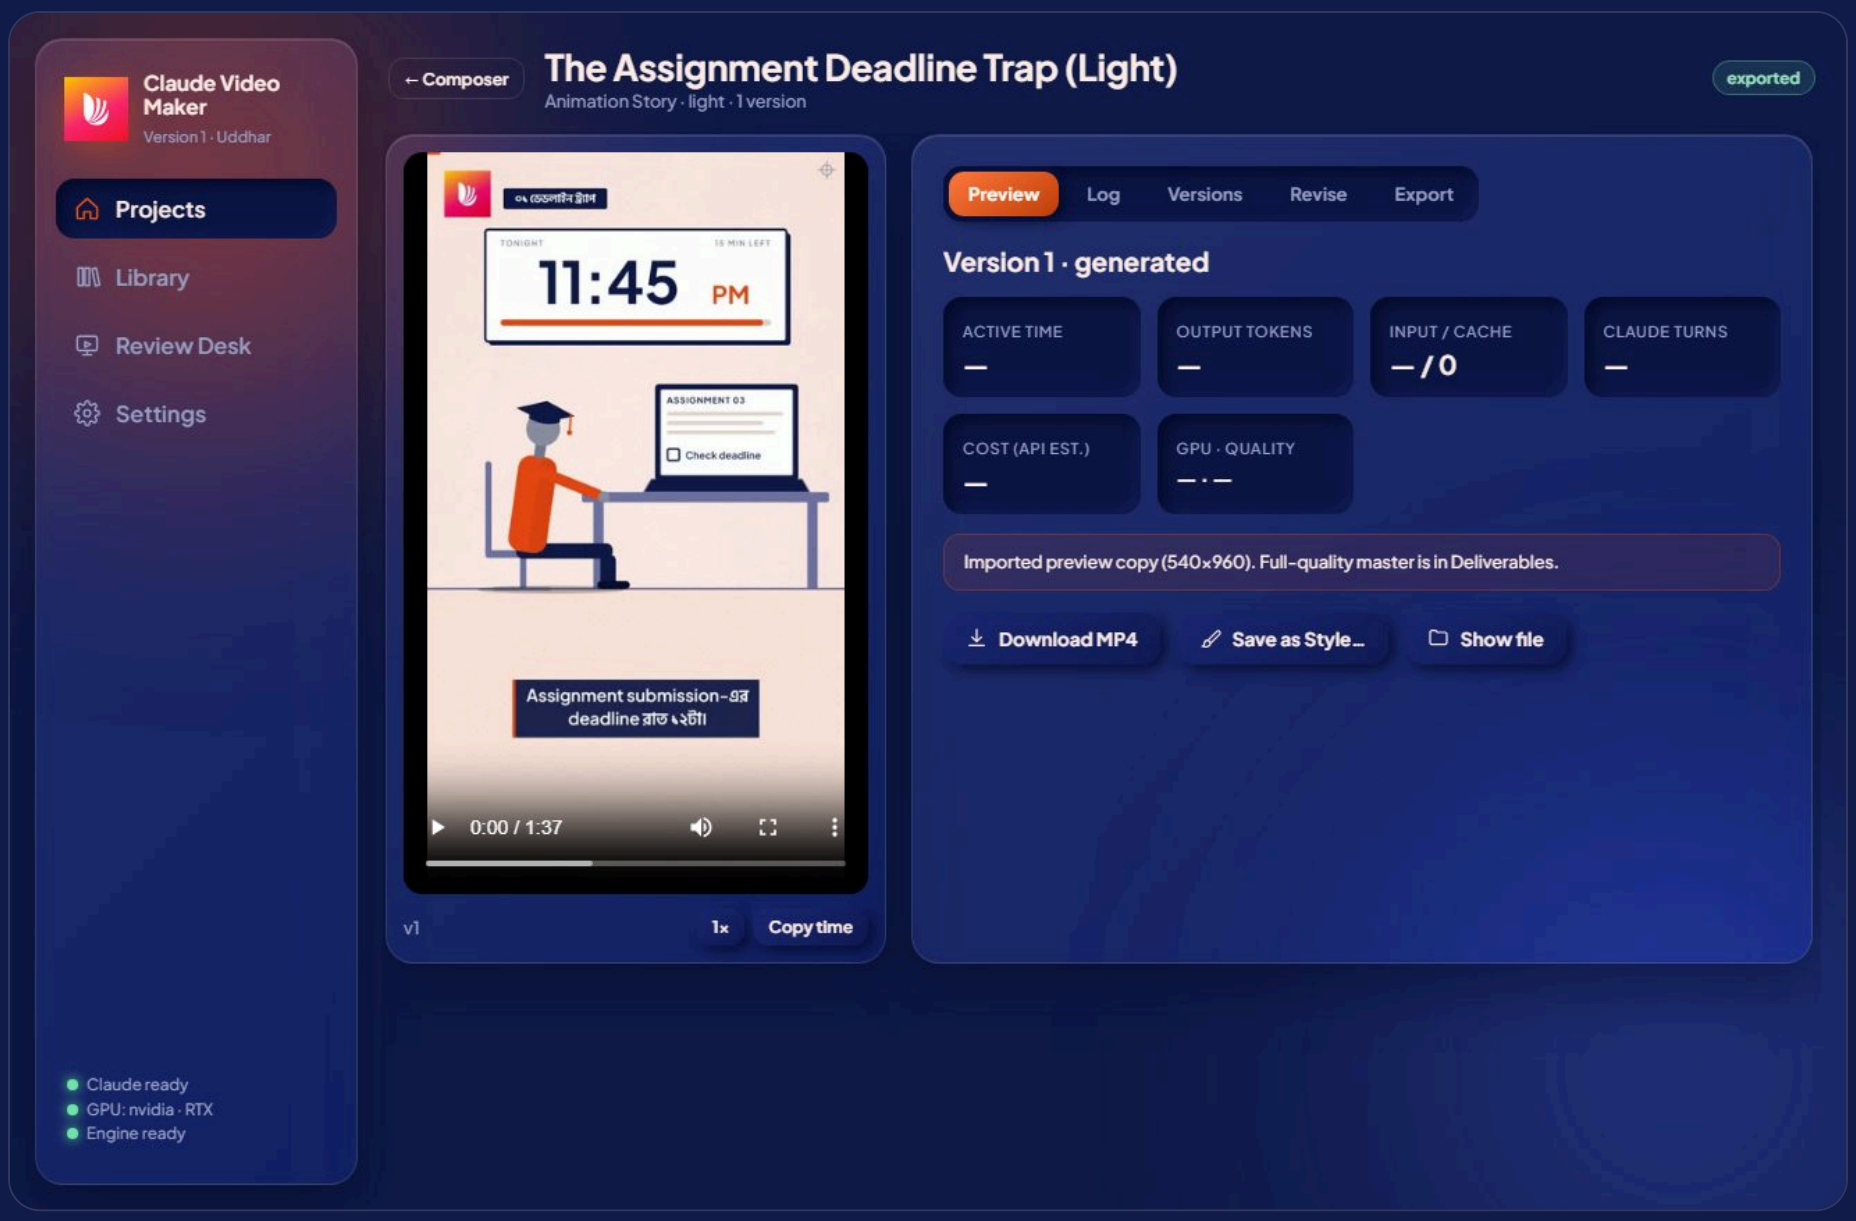

6 · Brief Review

Shown before anything starts. Problems appear in red or as warnings; you cannot generate while there is a red error.

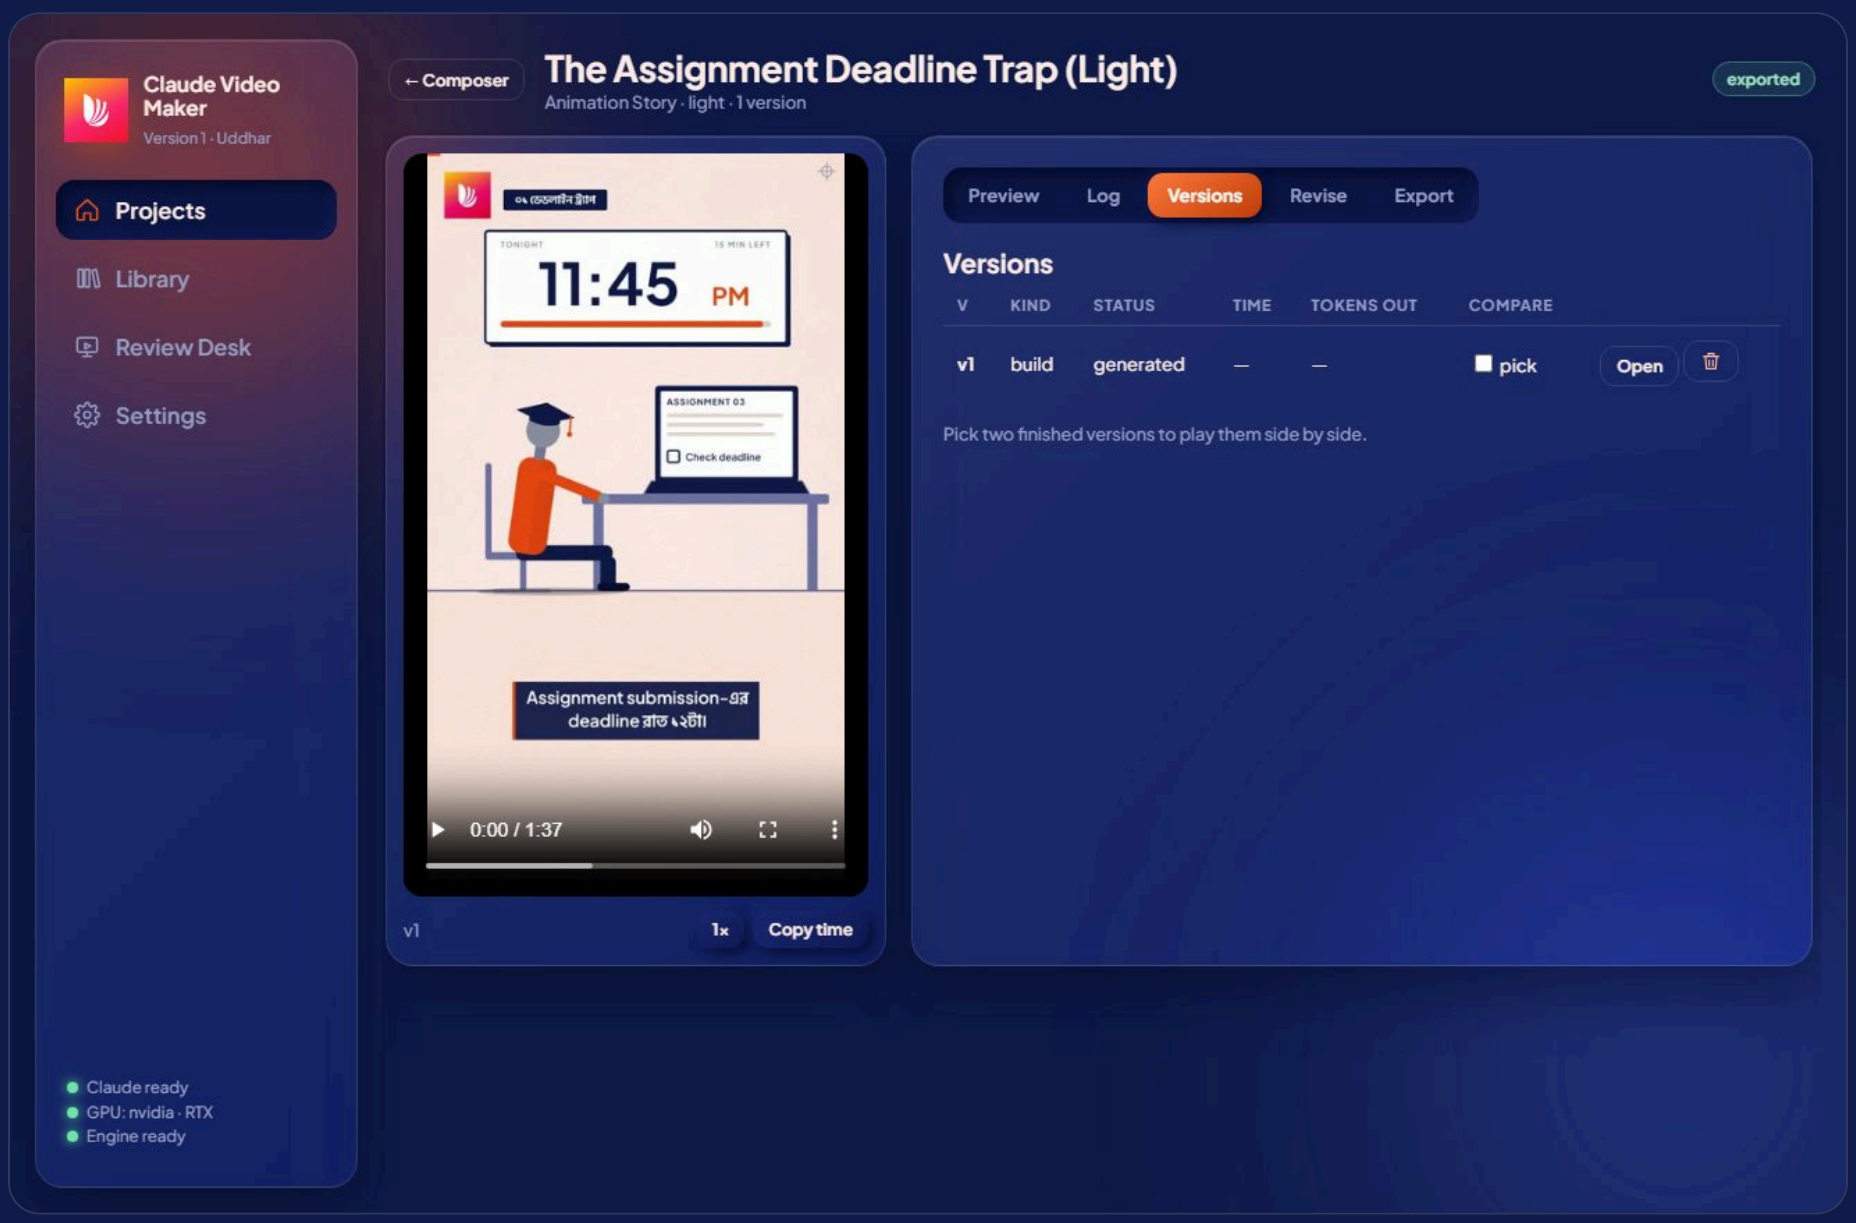

Everything Claude will use, checked.

7 · Results

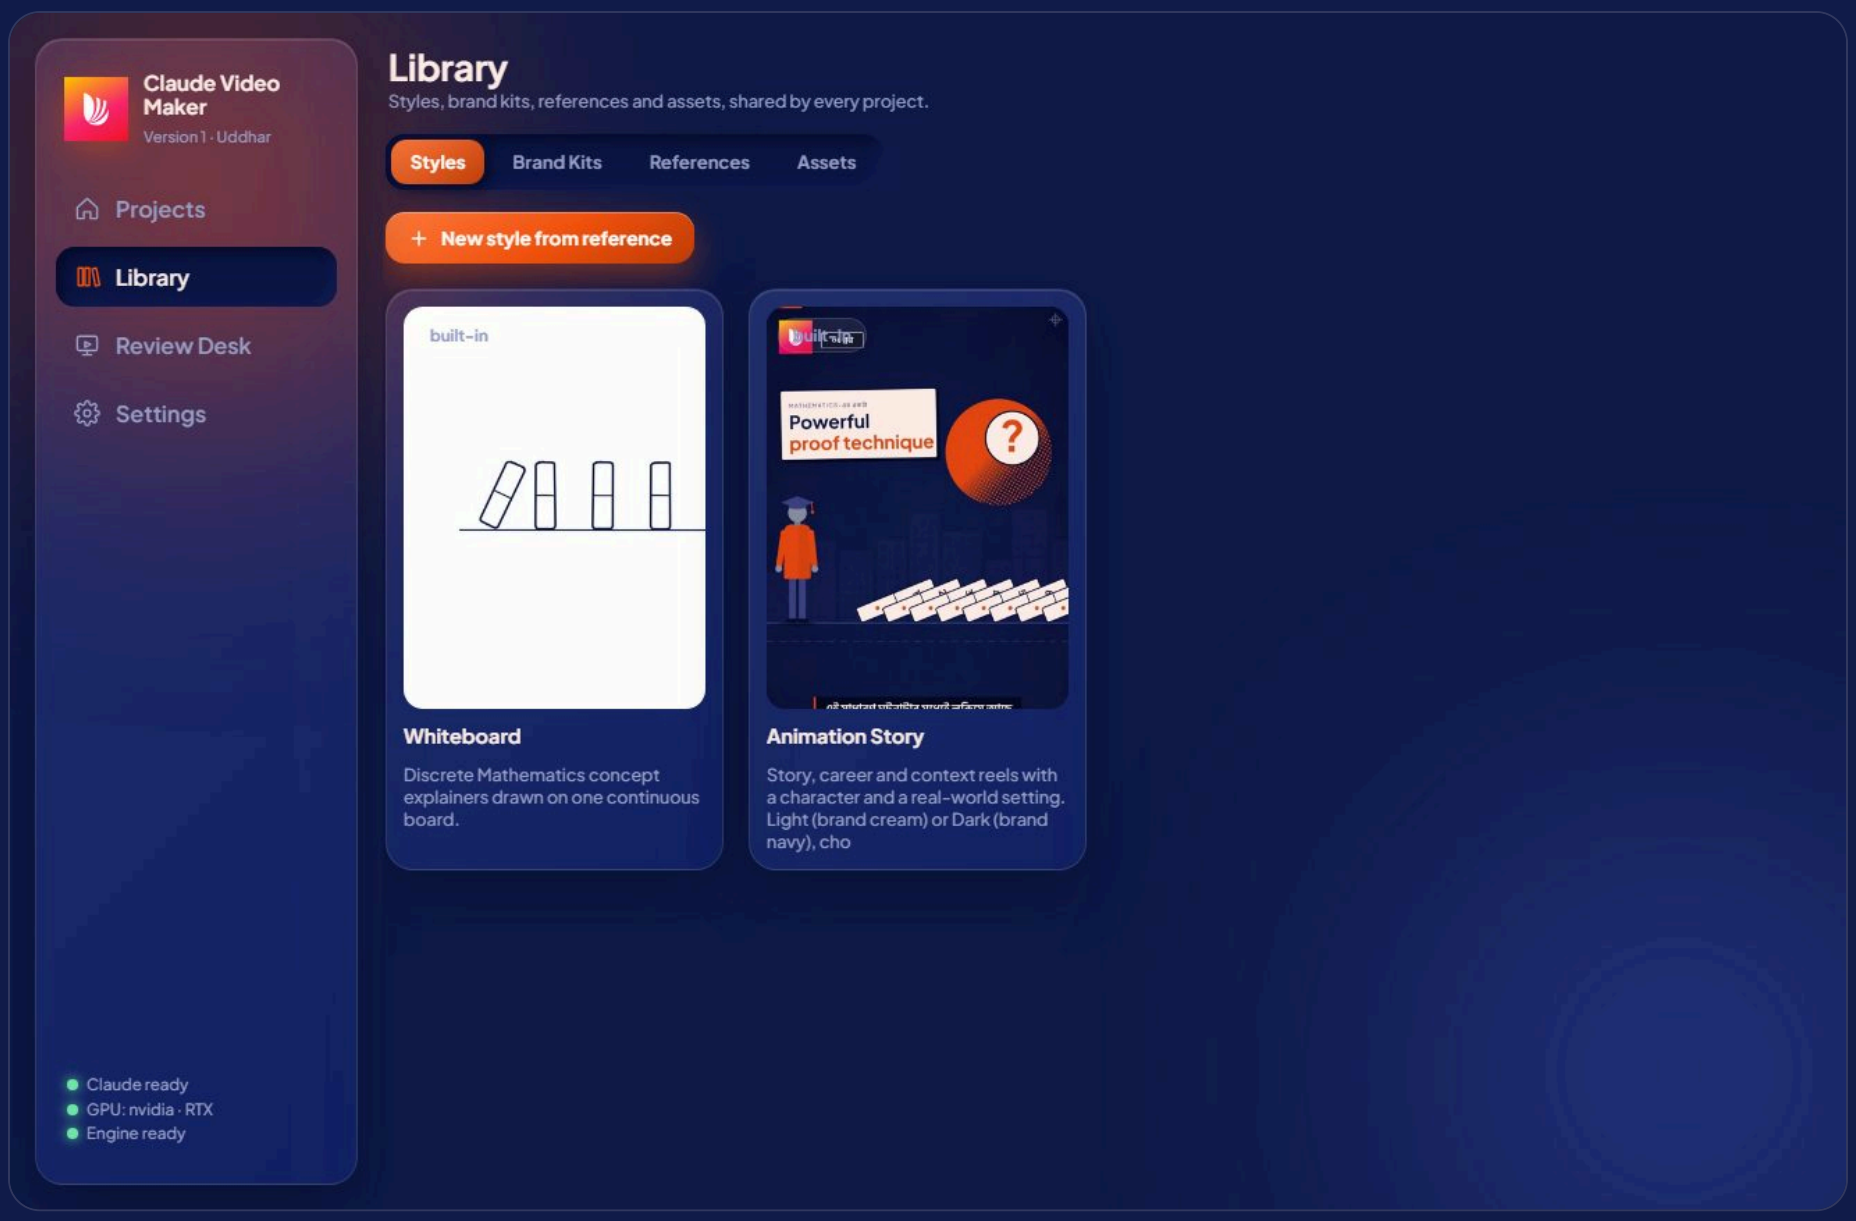

Player and production summary; Log, Versions, Revise and Export tabs.

8 · Versions

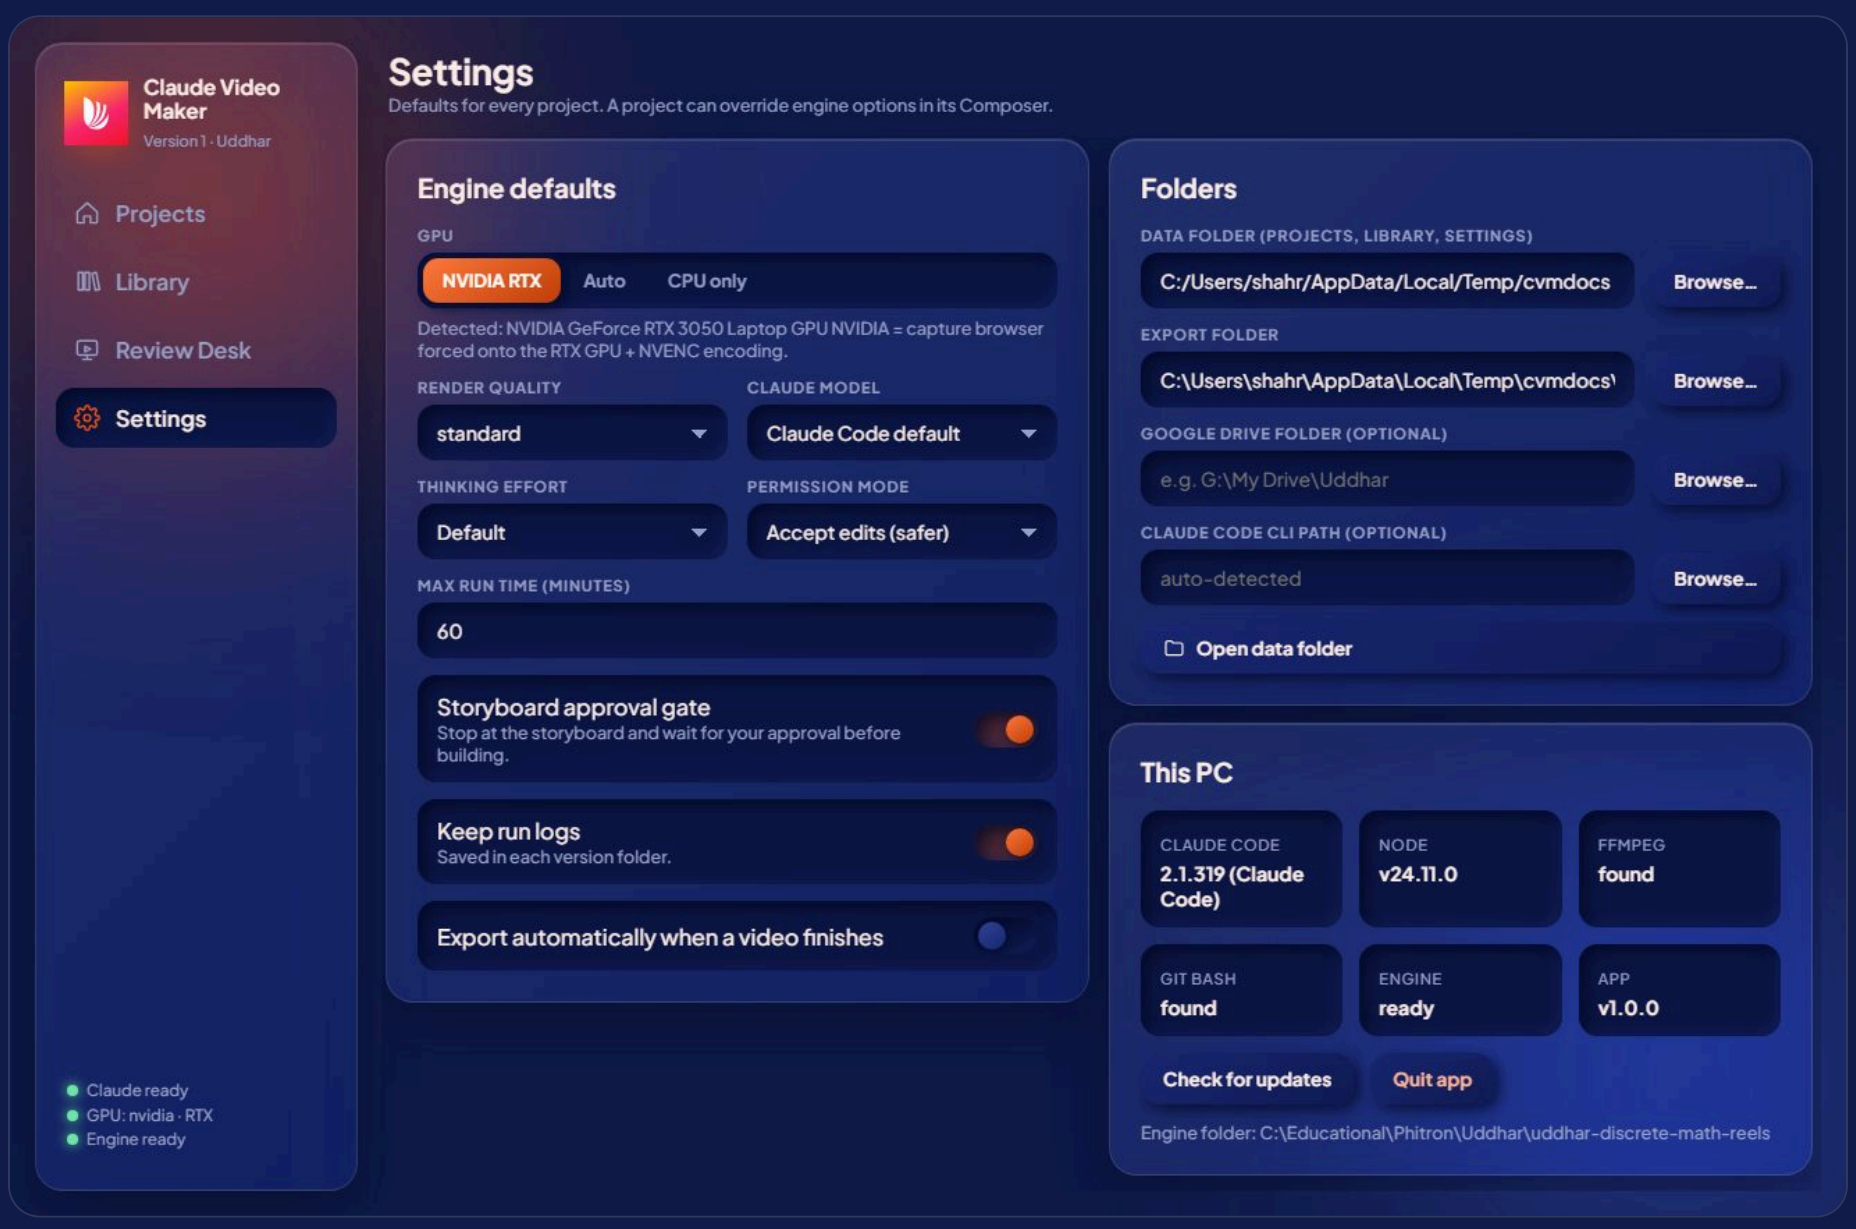

Pick two versions to compare side by side.

9 · Library

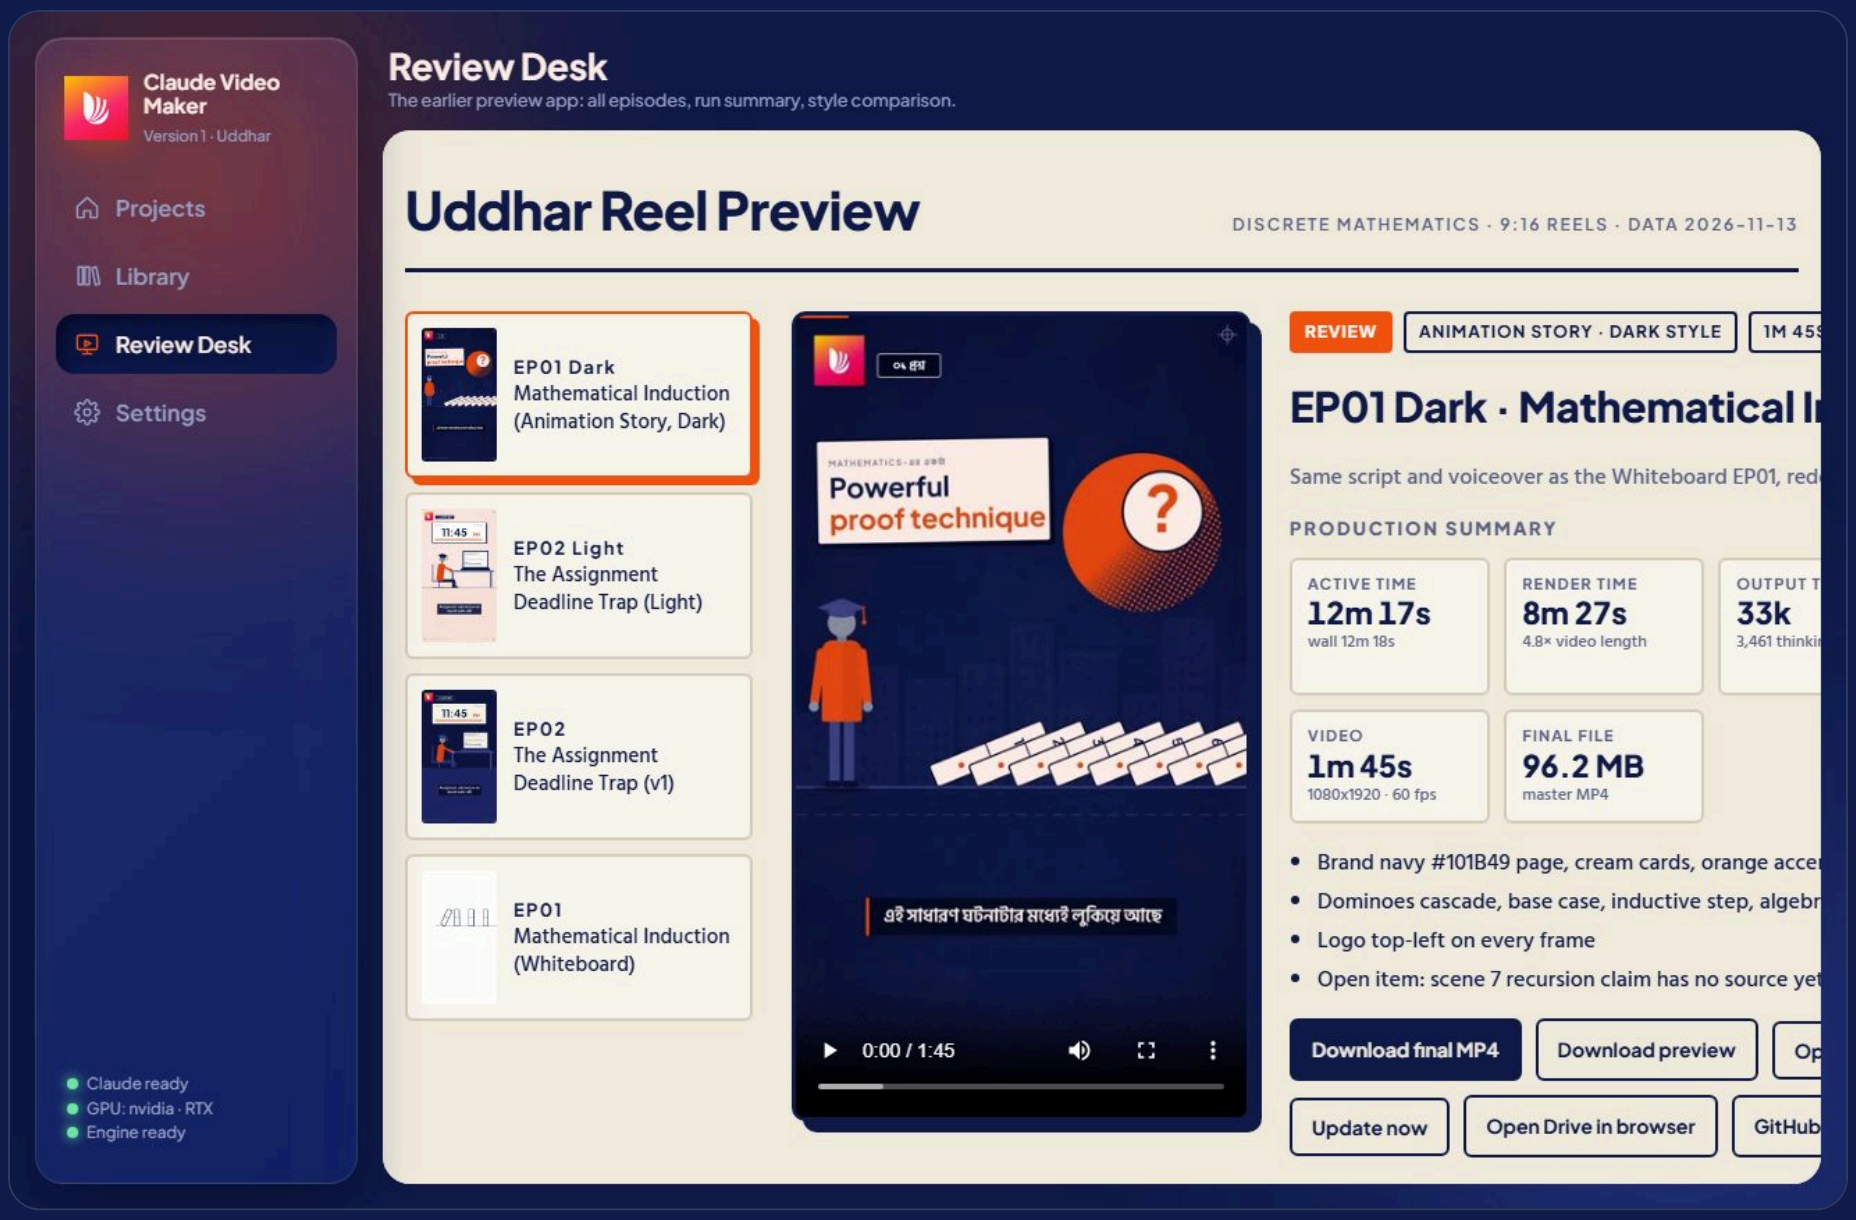

Styles, Brand Kits, References and Assets in one place.

10 · Settings

Defaults for every project, folders and a health check of this PC.

All episodes with production summary and style comparison.

BY METHOD

How-to recipes

Make a reel

1. **+ New Project** and name it.
2. Content: paste the script (it is used as given). Add storyline notes or files if you have them.
3. Style: choose one. For Animation Story choose **Light** or **Dark**.
4. Audio: browse to the voiceover. It sets the timing.
5. **Review & Generate** → fix any red items → **Generate storyboard**.
6. When the storyboard appears, read it, add notes if you like, **Approve & build video**.
7. When it finishes, watch it in Results.

Change one scene without redoing the video

1. Results → select the version → play to the moment → **Copy time**.
2. Revise tab → enter the scene number, press ⏱ to stamp the time, write what should change. Add more rows if needed.
3. **Revise** → **new version**. Only the listed changes are made; the previous version stays.

Compare two versions

Results → Versions → tick **pick** on two finished versions → **Play both**.

Save a look as a style

Results → Preview → **Save as Style…** → name it and describe what defines it. It appears in Library → Styles with a thumbnail and can be chosen in any project.

Create a style from a new reference

Library → Styles → **New style from reference** → add the video or image → optionally **Analyze with Claude** to draft the rules → edit → Save.

Choose which GPU renders

Everywhere: Settings → GPU. One project only: Composer → Engine & Render → GPU. **NVIDIA RTX** forces the capture browser and encoder onto your RTX card.

Export for delivery

Results → Export → choose the version → **Export**. The MP4, storyboard, brief and run summary go to the Export folder and, if set, the Drive folder. Turn on Auto-export in Settings to do it automatically.

Protect an approved project

Composer → **Lock**. Editing and generating are blocked until you unlock it.

Reuse a project's setup

Projects → hover a card → duplicate icon. All inputs are copied; versions are not.

FOR THE CURIOUS

Under the hood

What happens when you press Generate

1. The app writes `brief.md` from your project and the library.
2. A lock file is created for the project.
3. It starts the Claude Code CLI inside the engine folder with your GPU, quality, model and effort choices.
4. Claude follows the repo rules and style skill, renders through `tools/hf.sh` (which reads the GPU choice), runs QA, and writes `versions/vN/DONE.json` and `final.mp4` .
5. The app records time, tokens, cost, GPU and quality for the version and releases the lock.

Where your data lives

```
Documents\Claude Video Maker\
  settings.json              app defaults
  library\library.json       styles, brand kits, references, assets
  projects\<id>\
    project.json             every input of the project
    brief.md                 what Claude was told
    uploads\                 files you dropped in
    versions\v1\             final.mp4, poster.jpg, storyboard.md, log-*.jsonl
  locks\                     active run and app lock files
```

project.json at a glance

```
{ "name": "EP03 Pigeonhole Principle",
  "content":  { "script": "...", "storyline": "...", "files": [] },
  "style":    { "id": "animation-story", "mode": "dark", "notes": "" },
  "references": [ { "type": "video", "path": "...", "note": "Only the card pop-in at 0:12" } ],
  "brandKit": { "id": "uddhar", "logoPosition": "top-left", "logoSize": 120 },
  "assets":   [ { "kind": "sticker", "path": "...", "use": "Scene 2" } ],
  "audio":    { "voiceover": "...", "music": "", "musicVolume": 0.12, "ducking": true },
  "output":   { "platform": "reels", "width": 1080, "height": 1920, "fps": 60, "captions": true },
  "engine":   { "gpu": "", "quality": "", "model": "", "effort": "", "gate": null },
  "versions": [ ... ] }
```

Privacy and safety. The app listens only on this PC (127.0.0.1) and its API needs a cookie only the app window receives. **Bypass all prompts** is off by default; turn it on only on a PC you trust, because Claude then runs commands without asking.

WHEN SOMETHING IS OFF

Troubleshooting

YOU SEE	WHY	FIX
“Claude Code CLI not found”	Not installed or not on PATH	Install it, sign in once with `claude`, or set its path in Settings → Folders
“Engine not ready”	Render packages not installed	Run the installer again, or `npm install` in the engine folder
Red “file missing or moved”	A file you added was renamed or deleted	Remove it in the Composer and add it again
Generate button disabled	A red item in Brief Review (often Light/Dark not chosen)	Fix the item and review again
“Another generation is running”	Only one run at a time	Wait, or press Stop on the running project
“Project is locked”	Lock is on, or a run is active	Unlock in the Composer, or wait for the run to end
GPU says NVIDIA but none detected	No NVIDIA driver or a PC without RTX	Install the driver, or set GPU to Auto / CPU only
Version “failed”	Claude hit an error or wrote no result	Open Results → Log, fix the cause (see error lines), generate again
App window does not open	Port 4180 busy or Edge/Chrome missing	Close other copies, or open `http://127.0.0.1:4180` in a browser

Good to know

Render time depends mostly on CPU frame capture, so a stronger GPU helps encoding more than capturing. Tokens and cost numbers come from the Claude CLI and are estimates. Imported episodes carry a 540×960 preview copy; the full-quality master stays in Deliverables.

CREDITS

Developed by Kazi Md. Shahriar

Claude Video Maker v1 was developed by **Kazi Md. Shahriar** for the Uddhar reels team at Phitron. It combines the Uddhar styles library, the HyperFrames render pipeline and the Review Desk into one

project-based app.
